

Introducing Freshwater Beach Monitoring Program at PHSKC

Presented by:
Jun Naotsuka, Beach Safety & Sewage Monitoring Lead

My areas of responsibility include:

- Sewage Release Response 
- **Freshwater Beach Monitoring** 
- Marine Beach Monitoring 
- Toxic Algae (HABs) Monitoring
- Recreational Shellfish Beach Monitoring 
- Miscellaneous Water Rec work 

Position funded through Foundational Public Health Services to deal with sewage

Topics Covered

- Freshwater Beaches in King County
- Health and Safety Hazards at Freshwater Beaches
- Laws, Rules, and Standards
- How PHSKC is Regulating Freshwater Beaches

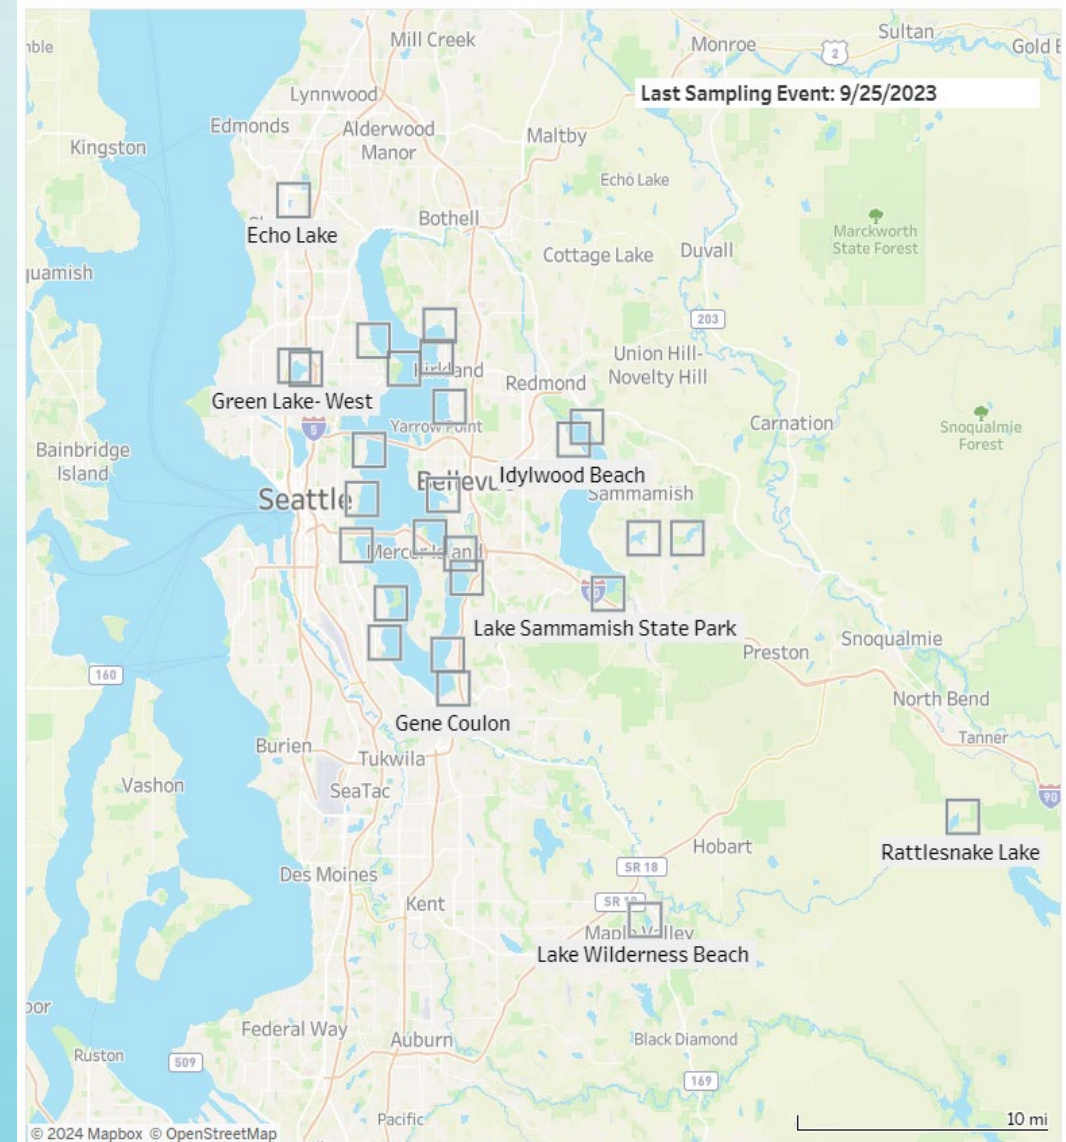

Freshwater Beaches in King County

Freshwater Beaches in King County

- We currently monitor 27 freshwater beaches in King County
- 8 Lakes involved

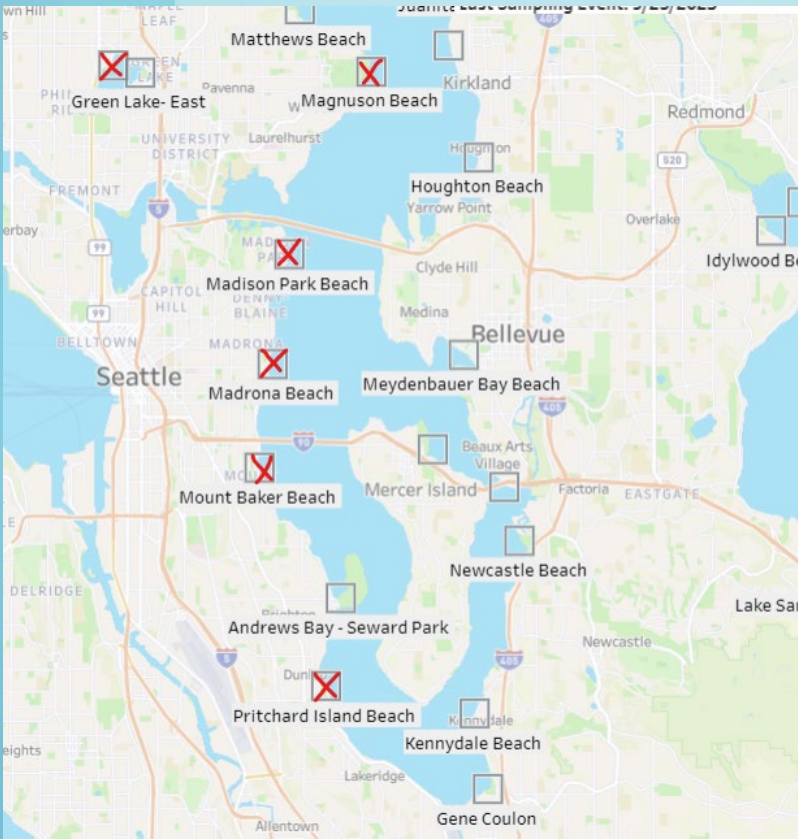

Lake	# of beaches
Lake Washington	17
Lake Sammamish	3
Green Lake	2
Beaver Lake	1
Echo Lake	1
Fivemile Lake	1
Lake Wilderness	1
Pine Lake	1

- 11 Municipalities involved

Beach Usage by Year

Seattle Parks Department counts bathers every 2 hours during open hours (4 times a day)

Year	2020 (1 st COVID year)		2021		2022	
	# of bathers observed					
	Active	Passive	Active	Passive	Active	Passive
Madison	4776	19126	11765	45728	12030	50025
Madrona	N/A	N/A	4991	11720	4254	13325
Magnuson	1674	5514	3991	10614	5862	13731
Mt Baker	868	2259	3995	8488	5962	15446
Pritchard	N/A	N/A	2196	6105	3215	9470
Green Lake West Beach	2818	7081	N/A	N/A	8571	12339

City of Seattle Parks Department Data

Madison Park Beach

Beach Usage (Active + Passive) by Months in 2022

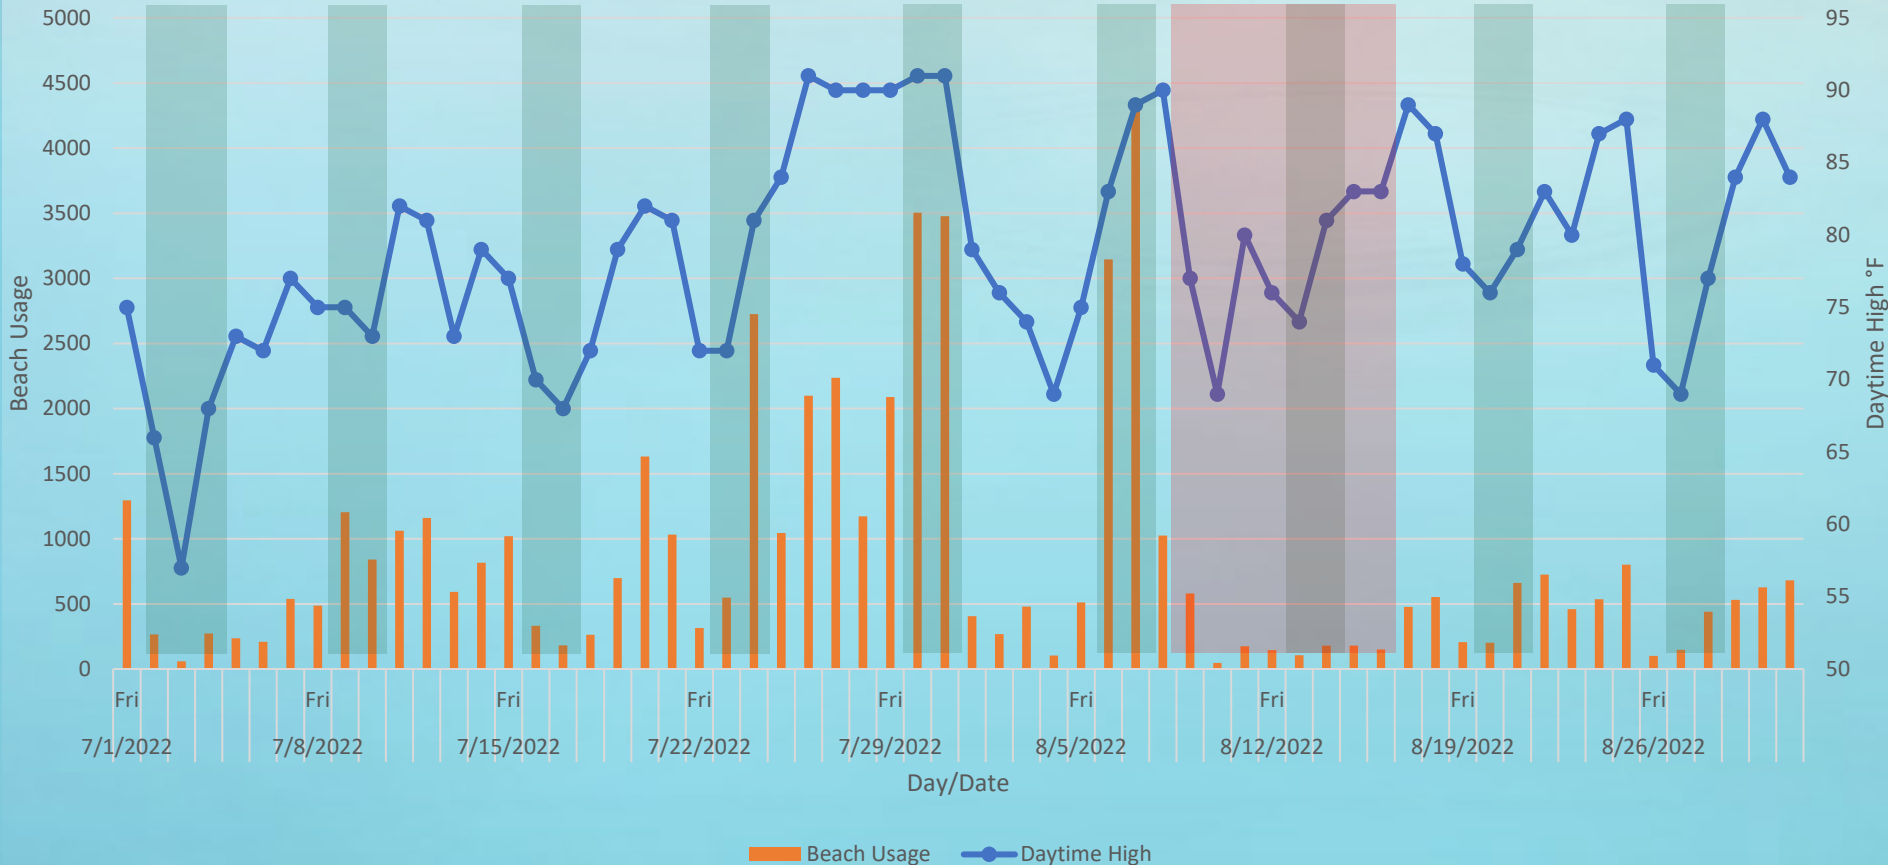

# of Days Included in Counting	
June	6
July	31
August	31
September	5

Beach Usage for Madison Beach in Jul-Aug 2022 by:

- Day of the week
- Daytime high

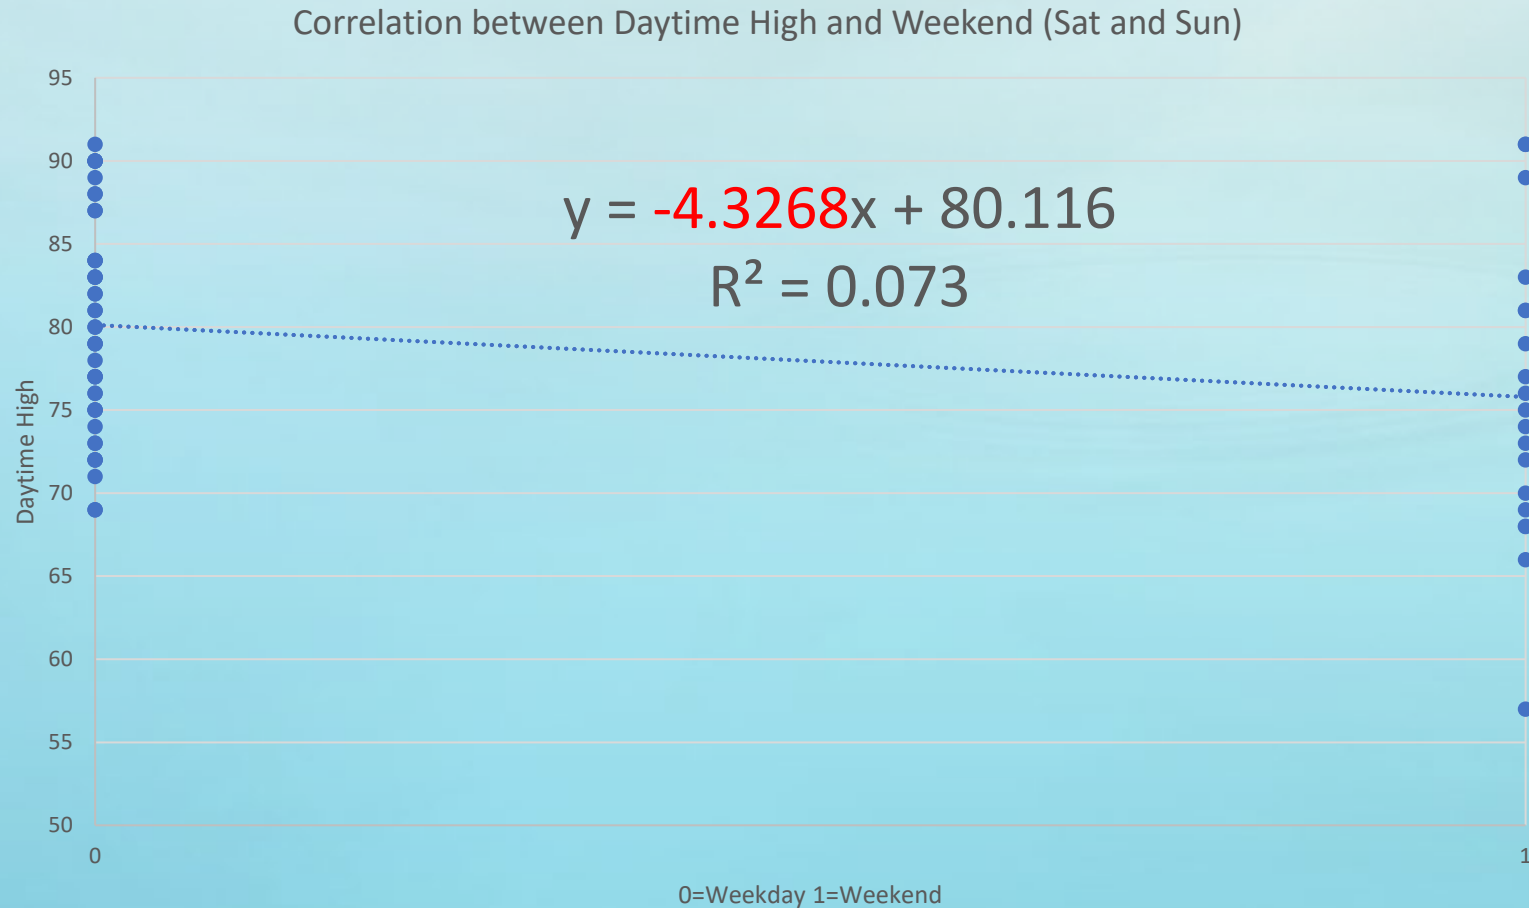

- Saturdays, Sundays and Holiday
- Beach Closed by PHSKC

Beach Usage by Day and Daytime High for Madison Beach July-August 2022

Correlation between Daytime Highs and Weekday Vs Weekend

Madison Beach Jul-Aug 2022
N=62

Weekends were **4.3** degrees cooler than weekdays on average but it's a weak correlation

Distribution of Daily Beach Usage

Madison Beach Jul-Aug 2022

N=62

Raw Beach User Count

Arithmetic mean = 844

Natural Logarithm of Beach User Count

$\log_e(\text{Beach User Count})$

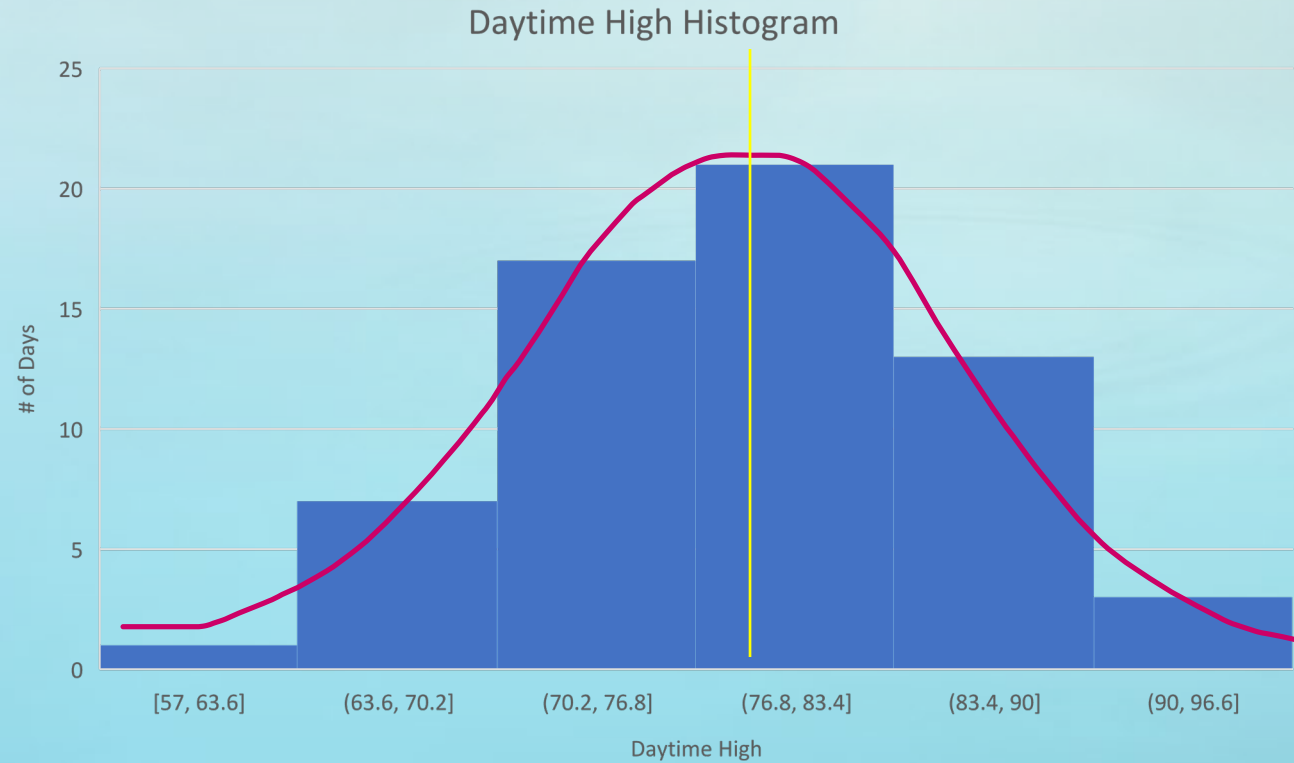

Arithmetic mean = 6.24

Antilog of arithmetic mean = 513

Daytime High Distribution

Madison Beach Jul-Aug 2022
N=62

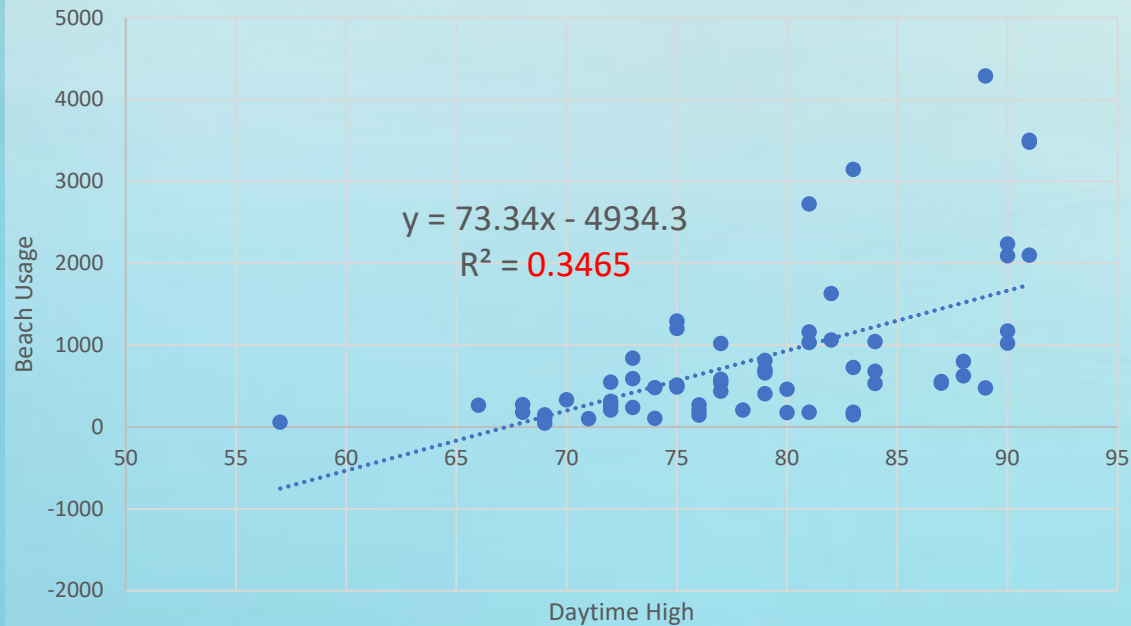

Arithmetic Mean = 78.8°F

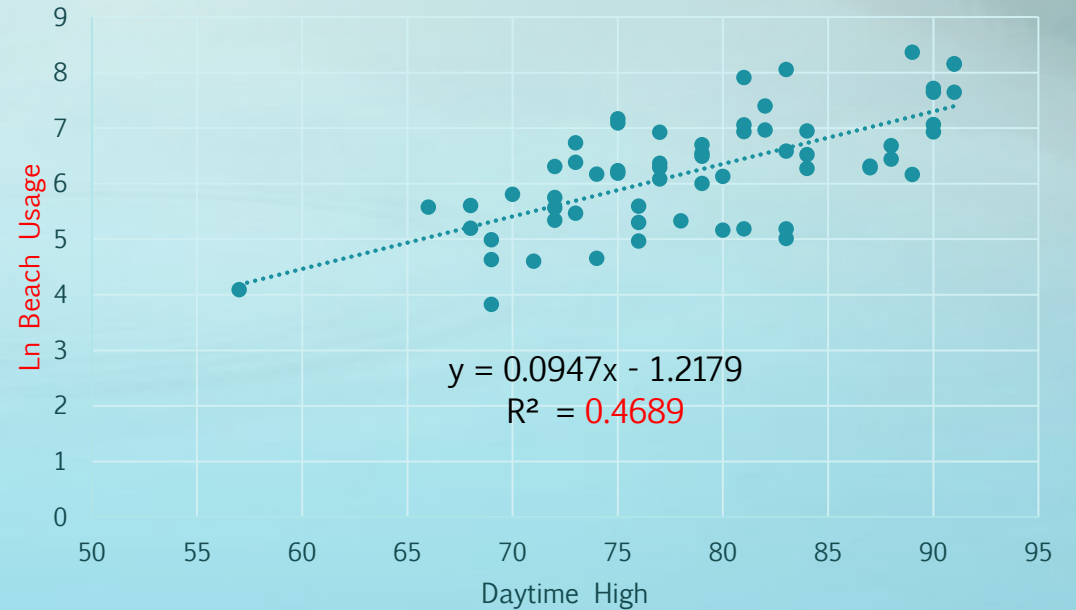

Correlation between Daytime Highs and Beach Usage

Madison Beach Jul-Aug 2022
N=62

Correlation between Beach Usage and Daytime High

Correlation between Ln Beach Usage and Daytime High

Stronger correlation when Log transformed

Multivariate Regression Analysis with: N=62

- Natural Log of Beach Usage as the Dependent Variable
- (Daytime High), (Weekday/Weekend), and (Beach Open/Closed) as the Independent Variables

<i>Regression Statistics</i>	
Multiple R	0.995168912
R Square	0.990361164
Adjusted R Square	0.973085271
Standard Error	0.636472546
Observations	62

	<i>Coefficients</i>	<i>P-value</i>
Intercept	0	#N/A
Weekend	0.404087895	0.022331
Closed	-1.19850515	1.56E-05
Temp	0.07951497	6.01E-56

At Madison Beach:

- $Beach\ Usage = e^{0.40409(Weekend) - 1.1985(Closed) + 0.079515(Daytime\ High)}$
- 97% of variability in Beach Usage explained by this model
- Weekend brings 50% more people than weekday does on average ($e^{0.40409} = 1.4979$)
- Beach closure brings 70% less people than otherwise ($e^{-1.19850515} = 0.30164$)
- Each 1 degree increase in daytime high brings 8% more people to the beach ($e^{0.07951497} = 1.08276$)

Disclaimer: This is a limited study with a very narrow scope!

Beach Usage

Beach Usage Pattern:

- Weekends bring more people to the beach
- Warmer temperatures bring more people to the beach
- Beach closure advisory is moderately effective at keeping people away from the beach (out of the water)

Things to keep in mind:

- High beach usage = A lot of exposure to beach water
- High fecal bacteria levels on a hot weekend is a big concern
- Beaches are sometimes used as cooling centers on hot days (Balancing between exposure to fecal bacteria and heat related risks is important)
- Who does and doesn't have access to alternatives (pools, air-conditioned places, etc.)?

Health and Safety Hazards at Freshwater Beaches

Health and Safety Hazards at Freshwater Beaches

- Physical hazards (Drowning and other injuries)
- Exposure to extreme temperatures and sunlight
- Pathogenic microorganisms (naturally occurring or through pollution) **Focus of this presentation**
- Toxic algae
- Hazardous chemical and physical agents
- Hazardous aquatic organisms (Swimmer's itch, Mosquitos, Alligators, Snakes, etc.)

Pathogenic microorganisms

- Fecal bacteria (mostly come from animals)
 - Fecal viruses (mostly come from humans)
 - Fecal parasites (can come from humans or animals)
- } Focus of this presentation
- Vibrio species (can be naturally occurring)
 - Amoebae (can be naturally occurring)

Laws, Rules, and Standards

Laws and Rules related to this Program

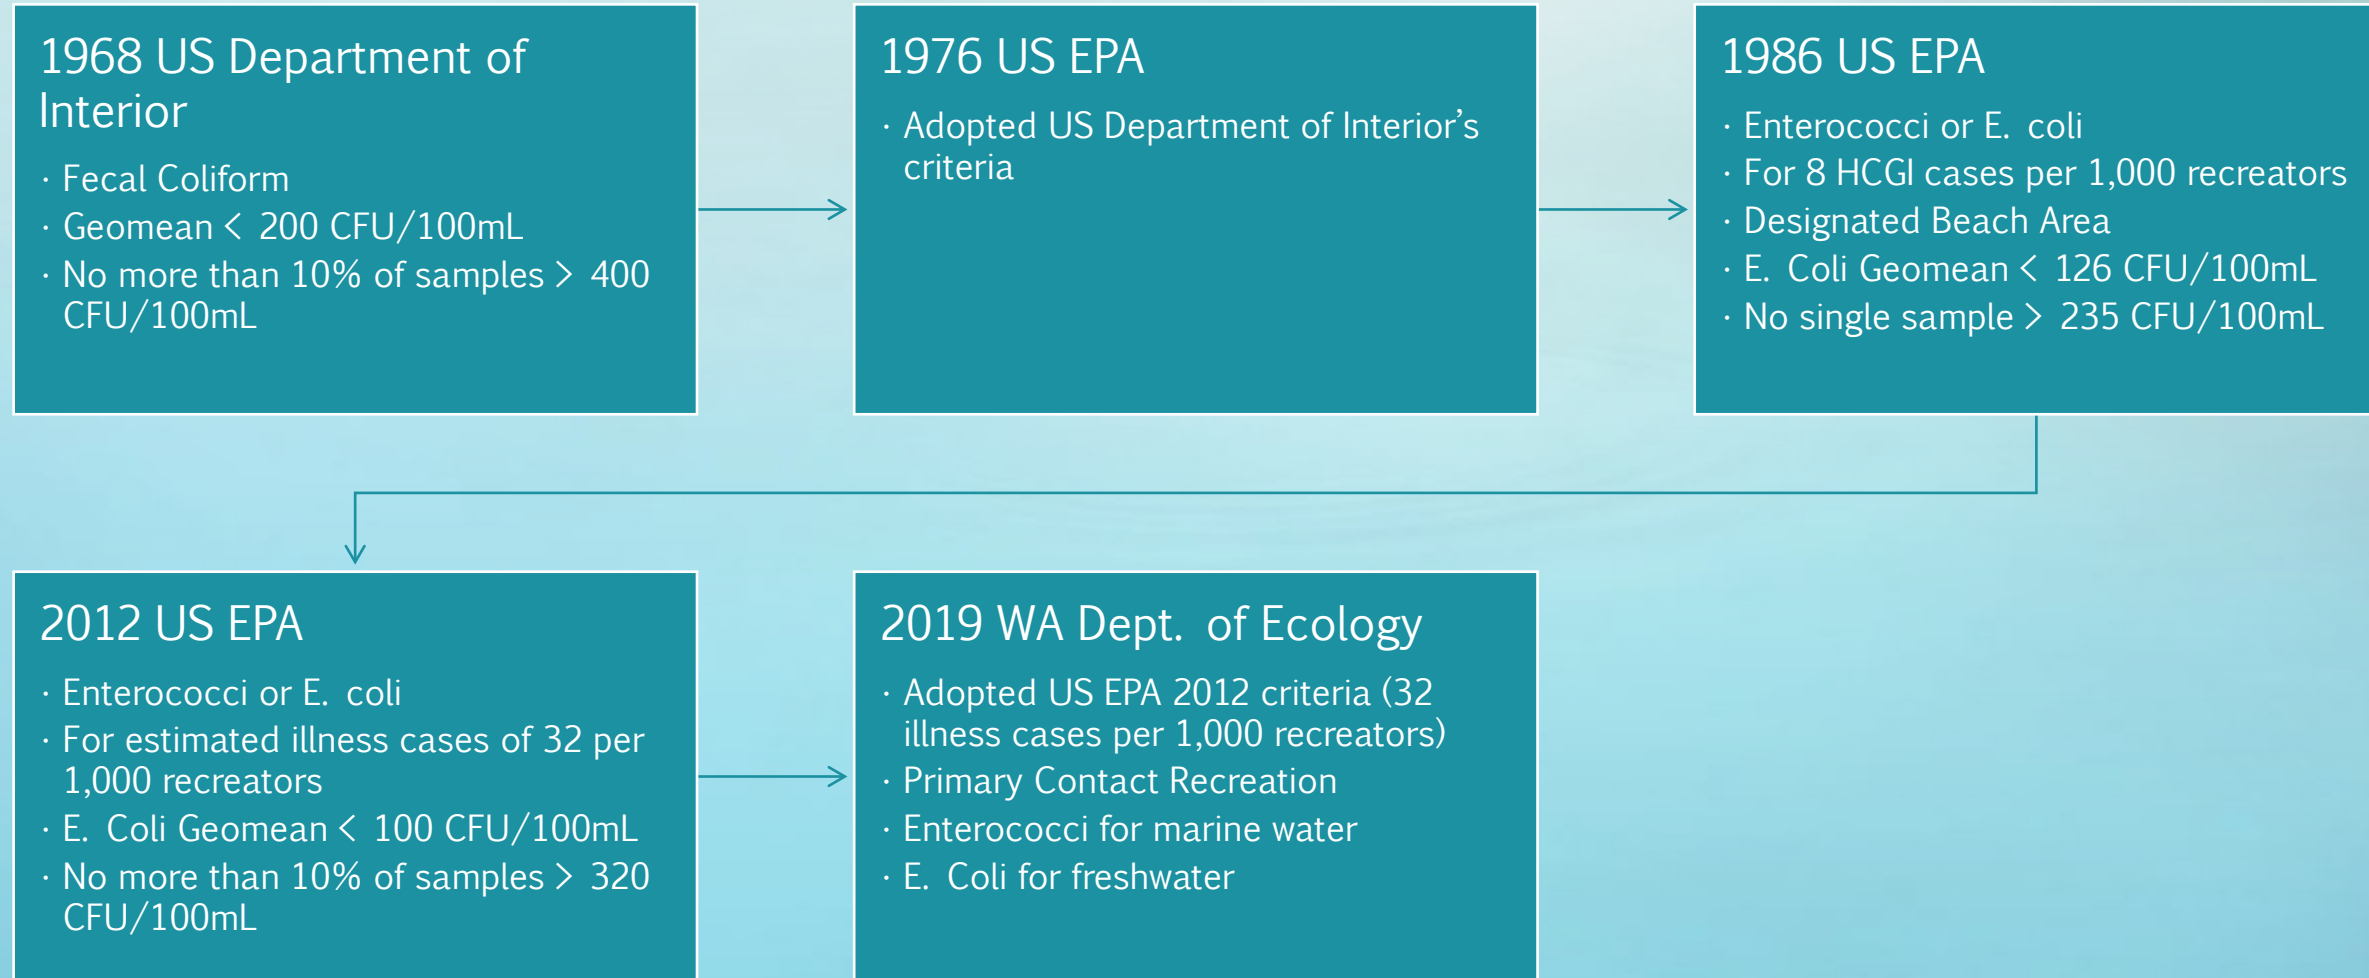

Authority	Laws/rules
EPA	Clean Water Act, CFR Title 40, Chapter I, Subchapter D, Part 131 (Water Quality Standards)
WA Dept. of Ecology	WAC 173-201A (Water Quality Standards for Surface Waters of the State of Washington)
SBOH/DOH LHJs	WAC 246-260-180 (Bathing Beaches)
LHJs	RCW 70.05.070 (Local Health Officer - Powers and duties)

<https://apps.ecology.wa.gov/waterqualityatlas/wqa/map>

Purple means the waterbody is for Primary Contact Recreation as per ECY

History of Beach Water Quality Standards

What is geomean?

Arithmetic Mean (Average)

$$= \frac{x_1 + x_2 + x_3 + \dots + x_n}{n}$$

1	2	6	100

$$x_1 + x_2 + x_3 + \dots + x_n = 109$$

$$n = 4$$

$$\text{Arithmetic Mean} = 27.3$$

Geomean (Geometric mean)

$$= \sqrt[n]{x_1 \times x_2 \times x_3 \times \dots \times x_n}$$

1	2	6	100

$$x_1 \times x_2 \times x_3 \times \dots \times x_n = 1200$$

$$n = 4$$

$$\text{Geomean} = 5.8857$$

Vs

Why geomean?

Bacteria concentrations are not normally distributed (N=57)

Raw Data			
Sample Date (mm/dd/yy)	Sample 1	Sample 2	Sample 3
5/13/2019	21	32	28
5/20/2019	450	220	690
5/28/2019	72	130	56
6/3/2019	14	17	34
6/10/2019	250	370	930
6/17/2019	520	80	190
6/24/2019	52	7	21
7/1/2019	170	180	46
7/8/2019	670	1600	230

8/19/2019	870	250	200
8/26/2019	10	6	2
9/3/2019	5	2	31
9/9/2019	680	60	560
9/16/2019	810	120	860

Raw data for Matthews Beach in 2019

Arithmetic mean = 241 CFU/100mL

Why geomean? (continued)

Log Transformed Data			
Sample Date (mm/dd/yy)	Sample 1	Sample 2	Sample 3
5/13/2019	1.32	1.51	1.45
5/20/2019	2.65	2.34	2.84
5/28/2019	1.86	2.11	1.75
6/3/2019	1.15	1.23	1.53
6/10/2019	2.40	2.57	2.97
6/17/2019	2.72	1.90	2.28
6/24/2019	1.72	0.85	1.32
7/1/2019	2.23	2.26	1.66
7/8/2019	2.83	3.20	2.36
7/15/2019	2.08	2.08	1.72
7/22/2019	2.15	2.74	1.63
7/29/2019	2.69	1.49	1.38
8/5/2019	1.66	1.79	2.46
8/12/2019	1.93	1.93	1.81
8/19/2019	2.94	2.40	2.30
8/26/2019	1.00	0.78	0.30
9/3/2019	0.70	0.30	1.49
9/9/2019	2.83	1.78	2.75
9/16/2019	2.91	2.08	2.93

Log-transformation makes it closer to normal curve (N=57)

Geomean = 92.4 CFU/100mL
($\log_{10} 92.4 = 1.966$)

Log transformed data for Matthews Beach in 2019

Do King County's Freshwater Beaches meet the EPA/ECY's Standard?

- Depends on the length of sampling/monitoring period
 - EPA says to use a 30-day period for water quality analysis
 - ECY says 90 days or less

	2019	2020	2021	2022	2023
# of beaches that violated standard at least once in any 30 day period	19	13	11	12	8
# of beaches that violated standard at least once in any 90 day period	13	8	6	9	5
Total # of Beaches Monitored	27	26	26	26	26

2012 US EPA

- Enterococci or E. coli
- For estimated illness cases of 32 per 1,000 recreators
- E. Coli Geomean < 100 CFU/100mL
- No more than 10% of samples > 320 CFU/100mL

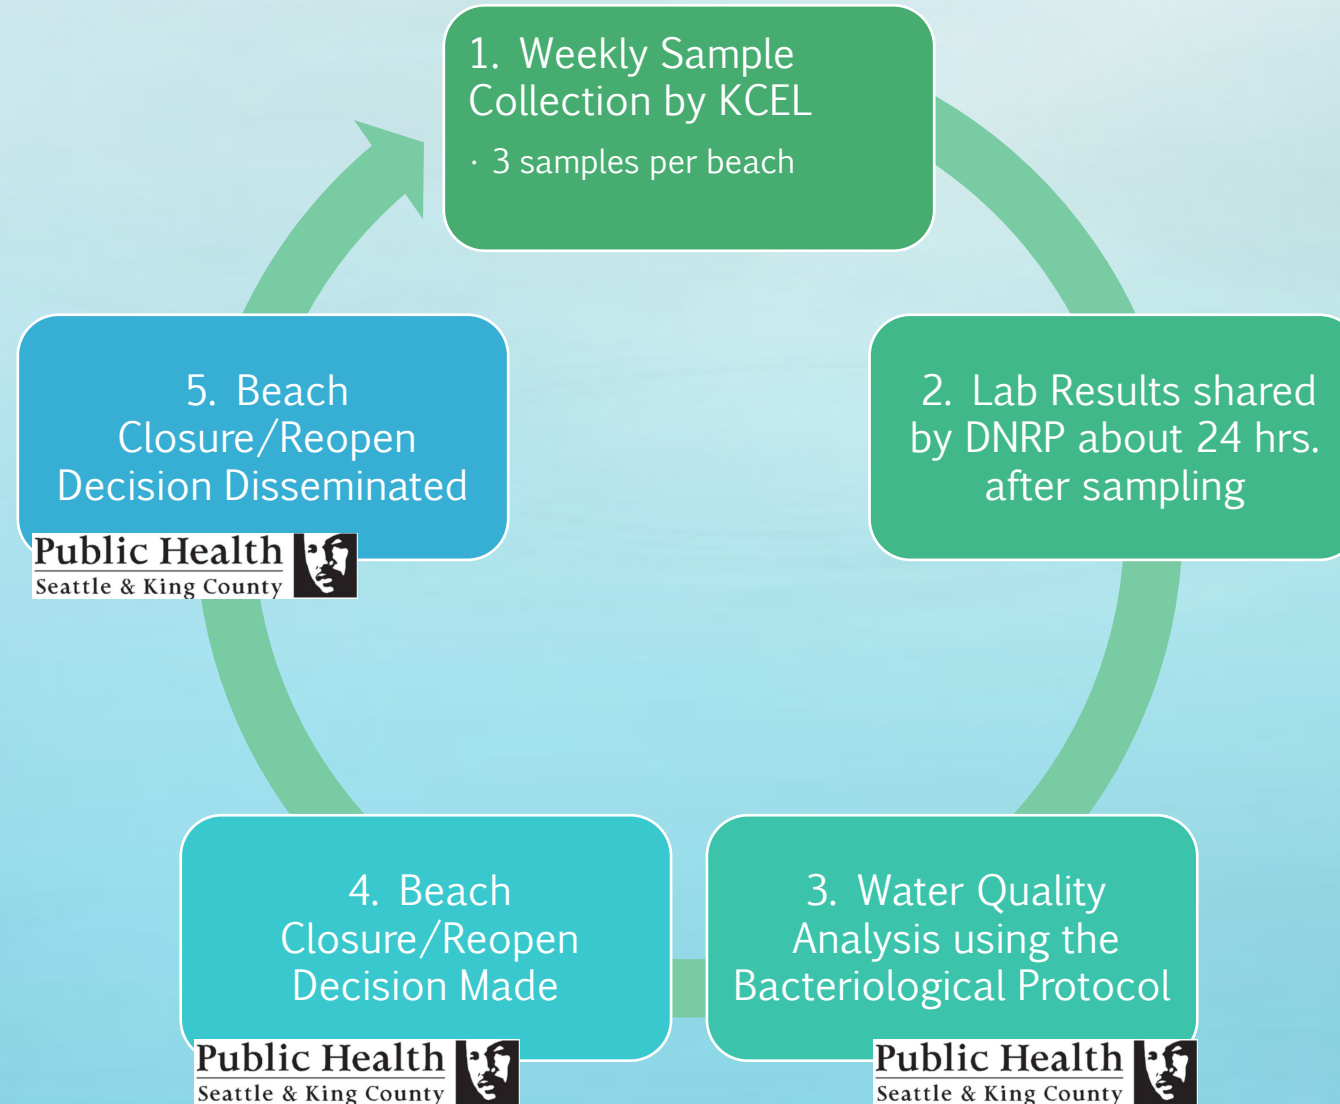

2019 WA Dept. of Ecology

- Adopted US EPA 2012 criteria (32 illness cases per 1,000 recreators)
- Primary Contact Recreation
- Enterococci for marine water
- E. Coli for freshwater

How PHSKC is Regulating Freshwater Beaches

Weekly Beach Monitoring Process in King County (Mid-May to Mid-September)

Development of New Beach Action Protocol in 2023

- Beach Action Protocol: Using Sample Results to Make Beach Open/Closure Decisions
- Old protocol (pre-2023): Modeled after an old outdated standard
- New protocol (post-2023): Purpose and objective of the New Protocol
 - Update and Modernize the Protocol Following EPA/ECY Standards
 - Minimize the change in the # of Beach Closures
 - Make it more sensitive to change in water quality so beach advisory decisions are more timely

King County's Freshwater Beach Action Protocol

1. If 2 or 3 samples this week are above 320 CFU/100mL, close the beach.
2. If only 1 sample this week is above 320 CFU/100mL, evaluate the last 30 days and:
 1. Close the beach if there is at least 1 other sample above 320 CFU/100mL in the last 30 days, or
 2. Close the beach if the geomean of all samples in the past 30 days is above 100 CFU/100mL.
 3. Otherwise, the beach remains open.
3. If no samples this week are above 320 CFU/100mL, the beach remains open, or it may reopen if it is currently closed.

This new protocol is more in line with the current EPA/ECY Water Quality Standards than the previous one

Simulation Results and Actual Results

Comparison between Previous and Current Protocols

	Previous Protocol	New Protocol
	# of Beach-week closures	# of Beach-weeks closures
2019	81	71
2020	39	44
2021	38	37
2022	34	41
2023	15	18

Successfully avoided changing the # of beach closures compared to the previous protocol!

Results (Continued)

Timeliness comparison between Previous and Current Protocols

Previous Protocol			New Protocol		
2019	Success rate=	81%	Success rate=	94%	
2020	Success rate=	89%	Success rate=	96%	
2021	Success rate=	88%	Success rate=	97%	
2022	Success rate=	89%	Success rate=	97%	
2023	Success rate=	93%	Success rate=	97%	

Success is defined as:

- Closing the beach when at least one sample shows a number higher than 320 CFU/100mL
 - Reopening the beach when there is no sample above 320 CFU/100mL

Increased the success rate!

Results (Continued)

Car fire caused the beach to close for 5 weeks

Still much to learn

- Are beachgoers getting sick?
- What kind of illnesses are common?
- Are E. coli good indicator organisms?
- Where are E. coli bacteria coming from?
- How much do E. coli concentrations vary?
 - from day to day or hour to hour
 - From one sampling location to another
- How many samples should be collected?

Studies being Considered

- Effect of Daytime High and Usage on E. coli concentrations
- Sanitary survey of beaches to identify sources of E. coli
- qPCR testing for Bacteroides to identify sources
- Hourly and real-time monitoring of E. coli concentrations
- Epidemiological investigation
- QMRA for specific pathogens
- Development of Beach Advisory Protocol using the results of the above studies

Acknowledgement

This Program would not be possible if it weren't for:

- FPHS funding
- King County Department of Natural Resources and Parks
 - Water and Land Resources Division
 - King County Environmental Lab
 - King County Wastewater Treatment Division
- City Parks Departments
